

## **Directions for Installing Security Plate Slide in Tracks on your Plexidor® Pet Door**

You will be installing these slide in tracks onto the face of your existing Plexidor® pet door. You will be taking out your pet door to do this. There are 3 parts to the slide in track - a bottom piece and 2 side pieces. Following are detailed instructions and photos:

Tools Needed:

Screw driver

Drill and 7/32 inch drill bit

Loctite (available at most hardware stores)

Fine Pointed Dark Marker

1. Unscrew the four mounting screws on your installed Plexidor® and slide the door out of the cut hole. Put the pet door face down on a level work surface.
2. You are going to mark the pet door frame where you will be drilling the 2 holes to screw on the bottom and side slide in track pieces.
3. Start with the bottom piece first. It is very important that you line up the bottom piece with the mitered joints at the bottom of the pet door. (see photos)
4. Once you have lined up the bottom piece with the mitered joints take a fine tipped marker and mark the screw holes.
5. Line up the left side of the slide in track frame piece with the mitered joint and use our marker to mark those 2 screw holes. Do the same with the right side.

Now that the frame has been marked to show where the screw holes will be, you are ready to drill the screw holes. Use a drill with a 7/32 inch drill bit to drill the screw holes.

Once you have drilled the holes, turn the door over so that the frame is facing up and position the bottom track piece and screw it in place. Then screw the left and right side track pieces in place.

Make sure the pieces all seem to be in place and then hold the door upright and slide the security plate in place to make sure everything is aligned properly. Then remove the security plate and turn the door back over so it is face down on the work surface.

Take the Loctite epoxy and epoxy the back of the slide in track mounting screws. This will stop the screws from loosening over time.

Now you are ready to re-install the pet door into it's mounting hole. Simply slide it back in place and rescrew in the mounting screws.

Unscrew 4 mounting screws and pull out pet door from mounting hole.

Line up bottom slide track piece with mitered corner joints.

Mark screw holes with fine pointed marker.

Screw hole marks should be approximately centered in the frame track as shown here. Check your marks after you draw them, if they are not close to centered, redo them.

Align first side piece with mitered joint and then mark screw holes with fine pointed marker, as you did with the bottom frame. Again, check that the screw hole marks are in the center of the frame track. Then repeat for final side piece.
